

Last class

- What are all the species in the Australopithecines?
- Which are robust? Which are gracile? What are the differences between robust and gracile?
- When do they occur in time? Space?
- How did they live? What did they eat? Where did they live?
- What are the possible phylogenies of the Pliocene hominids?

Last time...

- What defines the genus *Homo*?
- When does *Homo* first appear? Where?
- How do we identify these fossils as *Homo* rather than *Australopithecus*?
- How are *Homo habilis* different from the other hominids they are contemporaneous with?

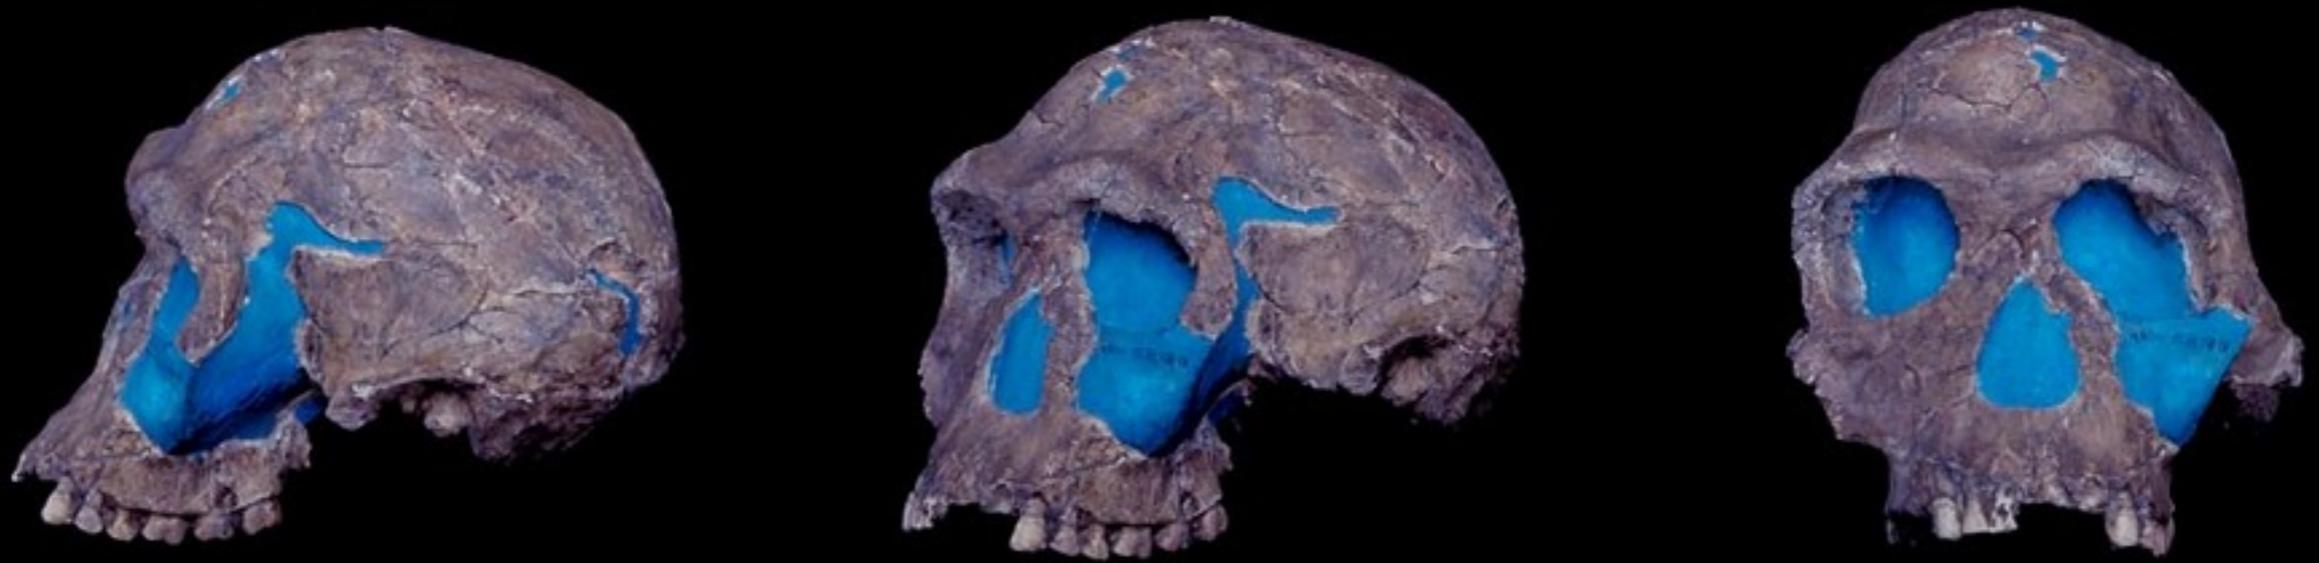

Homo habilis

- Where and when is *Homo habilis* found?
- What are its defining characteristics?
- Why is it considered *Homo* rather than *Australopithecus*?
- How is it similar and dissimilar from *Australopithecus sediba*?
- How is it similar and dissimilar from *Homo rudolfensis*?

Defining *Homo*

- Rasmussen: Primate genus containing species of relatively small-toothed, big-brained, stone-tool-making hominids
- Walker: relatively large brain cases, completely modern limb proportions, and relatively small teeth
- Wolpoff: expanded cranial capacity, reduced canine size, precision grip

Homo habilis

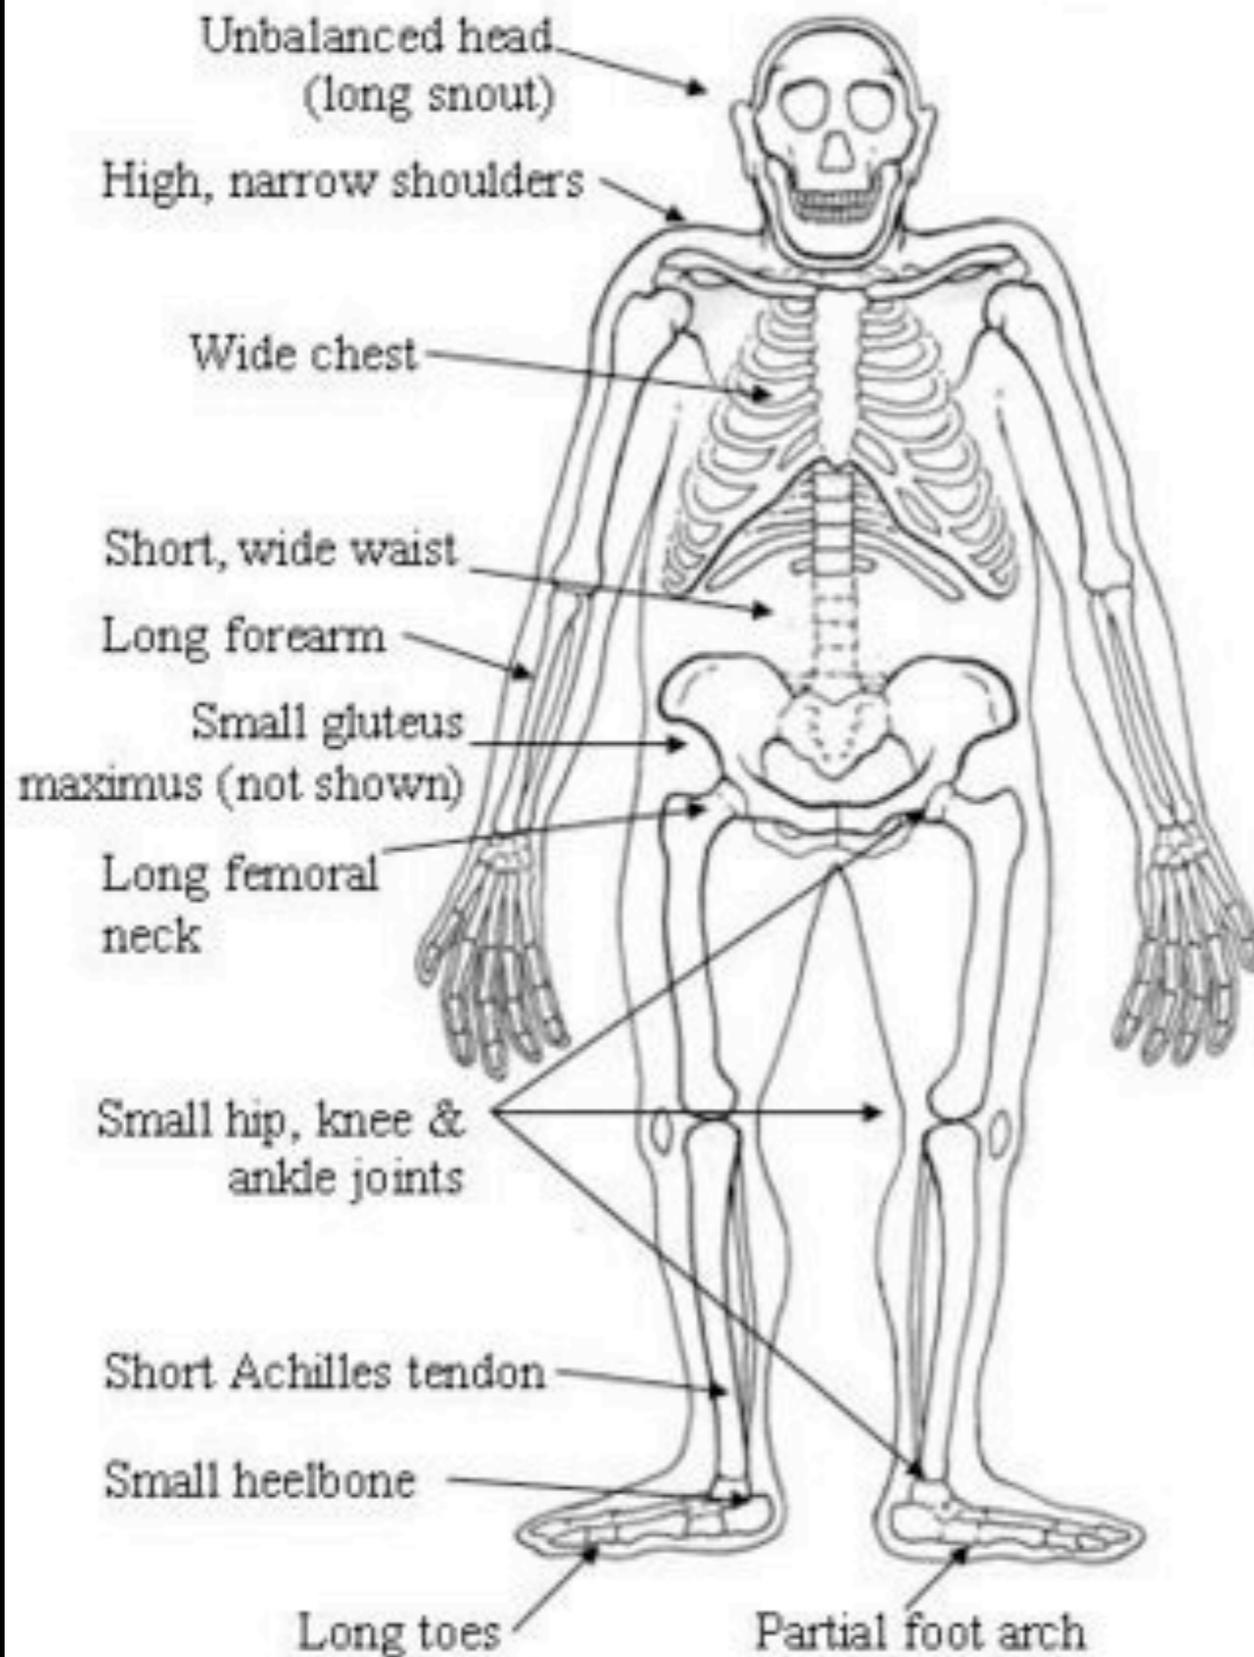

Australopithecus v. *Homo habilis*

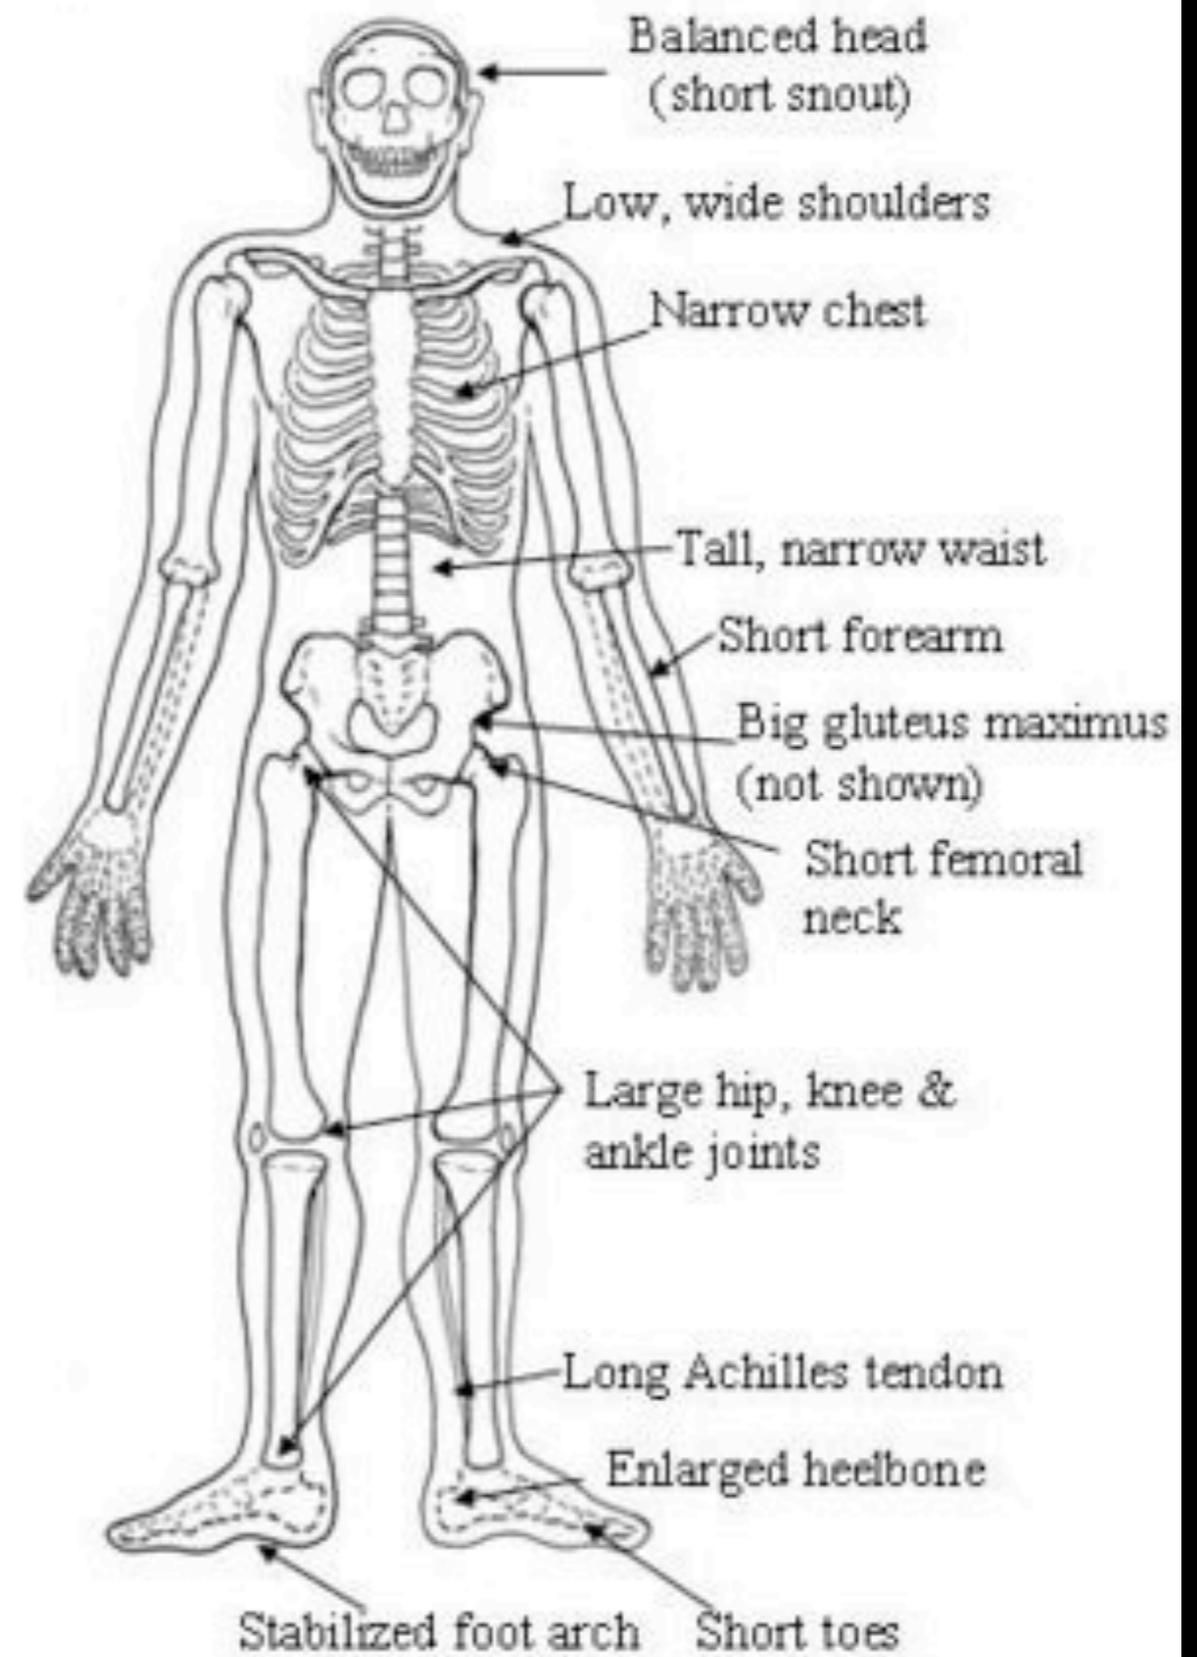

© 2001 Scott Bjelland and www.ArchaeologyInfo.com

Australopithecus afarensis
(walker & tree climber)

Homo erectus
(walker & endurance runner)

Homo

- brain size greater than 500 cc
- smaller, less prognathic face
- smaller teeth than the australopithecines
- more efficient bipedalism

Homo species

- *Homo habilis*
- *Homo rudolfensis*
- *Homo georgicus*
- *Homo ergaster*
- *Homo erectus*
- *Homo floresiensis*
- *Homo heidelbergensis*
- *Homo rhodesiensis*
- *Homo antecessor*
- *Homo neandertalensis*
- *Homo sapiens*

Homo habilis

Parabolic arcade

Round vault
(no keels)

Small or no
supraorbital torus

No canine
fossa

Small brain
($>$ *Australopithecus*)

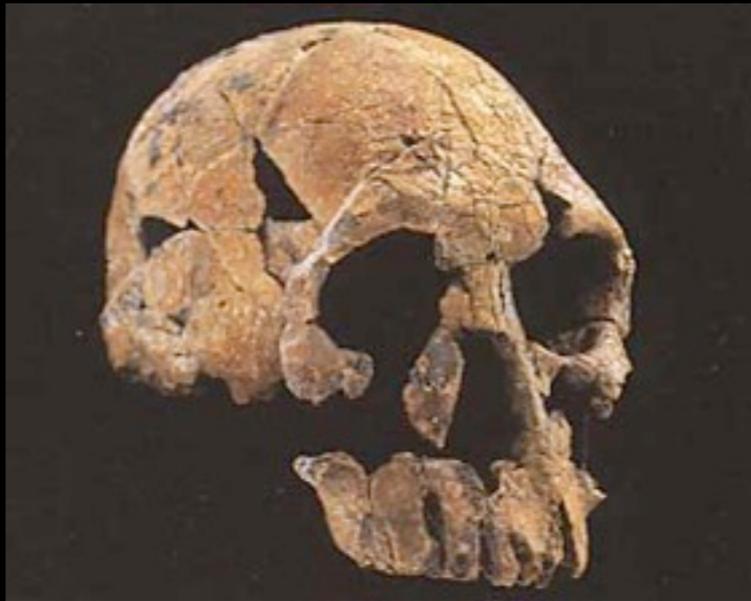

Somewhat
prognathic
($<$ *Australopithecus*)

Homo habilis

Homo rudolfensis

Homo rudolfensis

- *Homo habilis* or something different?
- *A. rudolfensis*?
- larger body than *H. habilis*
- larger brain than *H. habilis*
 - but smaller EQ
- bigger teeth than *H. habilis*

Why *Homo*?

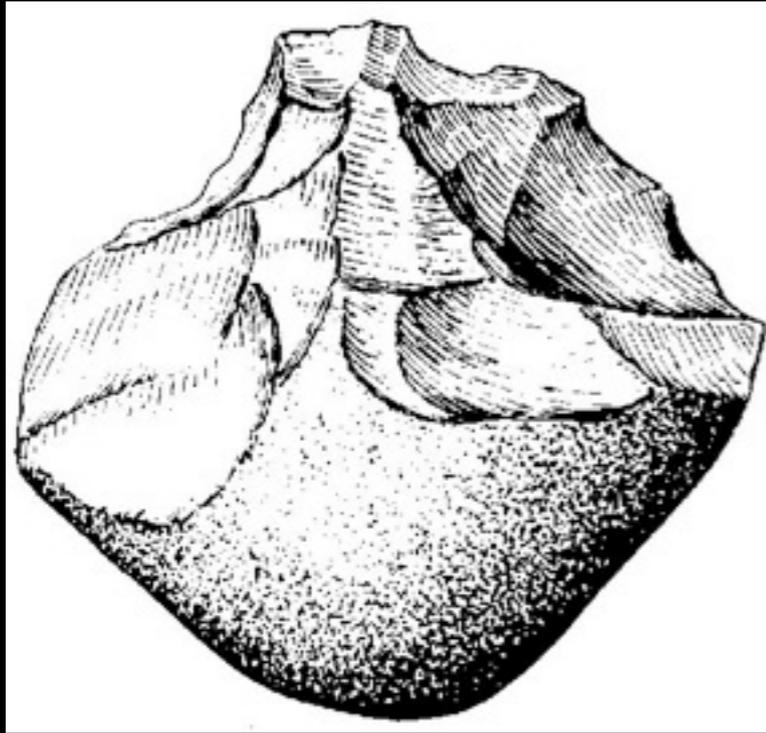

- What is the adaptive pattern of early *Homo*?
- Why were big brains and small teeth suddenly and strongly selected for?

Olduwan tools

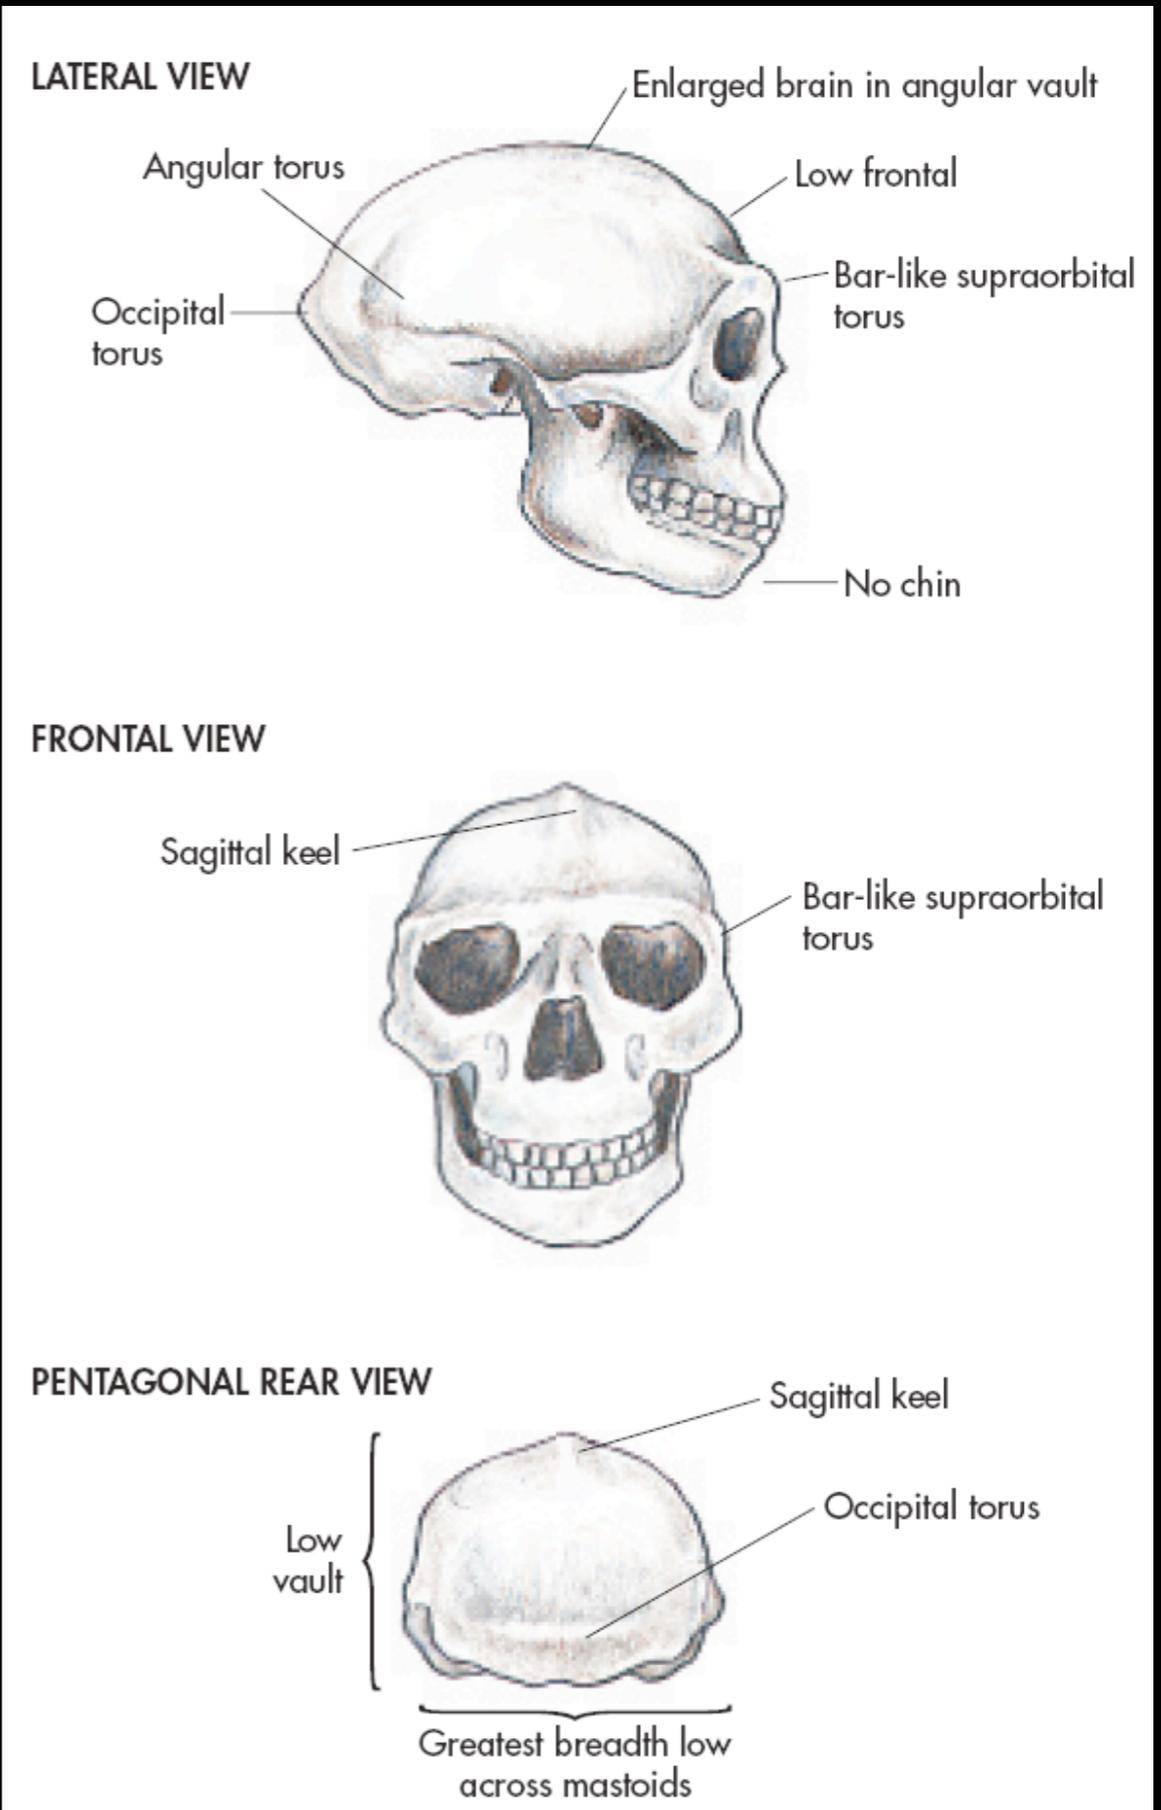

Homo erectus

- an extinct species of relative large African and Eurasian hominids characterized by a modern post-cranium, slightly projecting face, pronounced superorbital torus, and medium sized brain (by hominid standards)

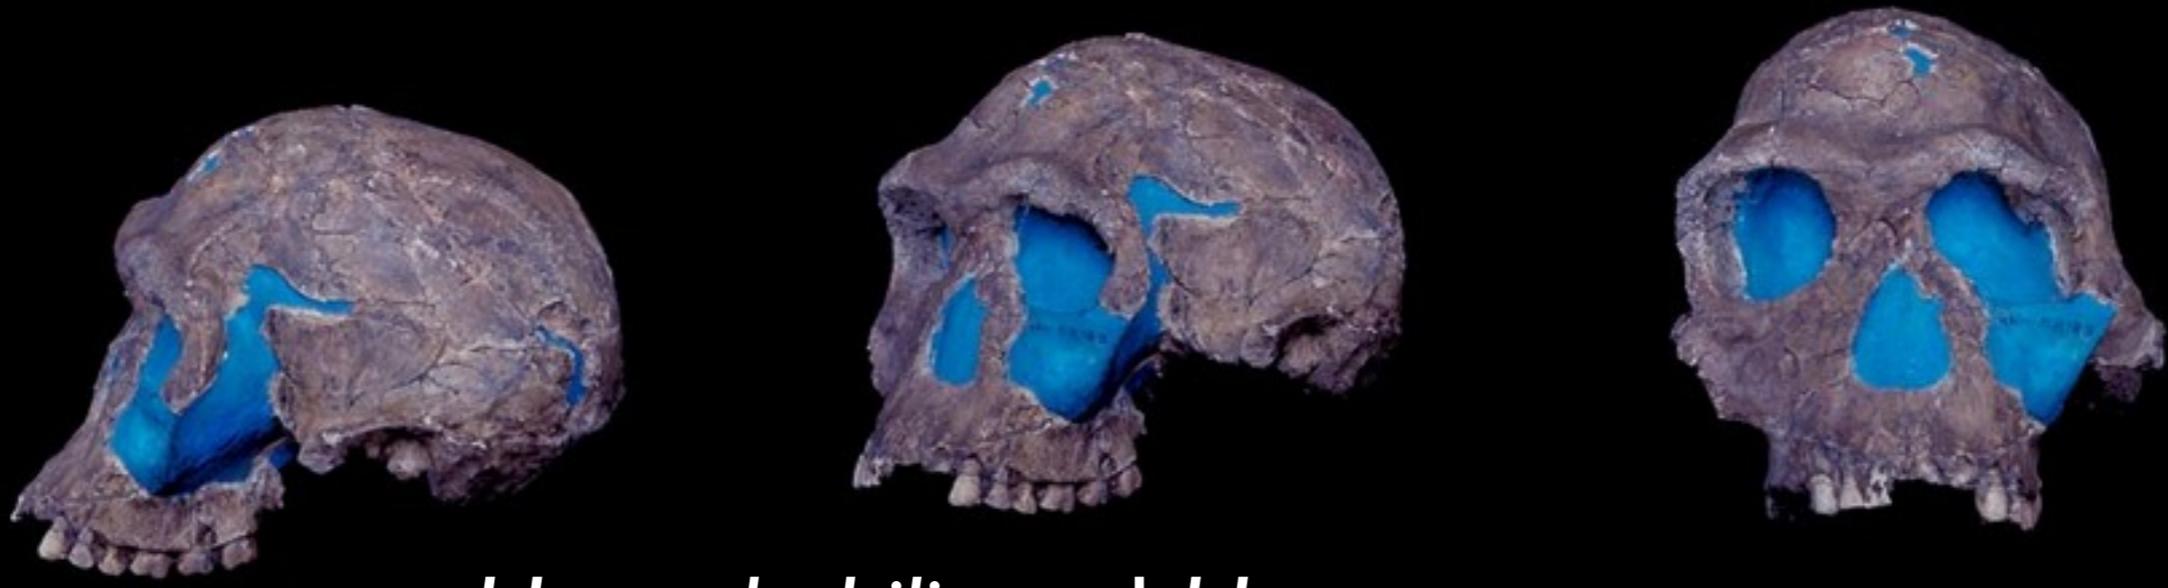

Homo erectus

- sagittal keel
- long, low skull
- nuchal torus
- supraorbital torus
- broad, flat nasal bones
- large mandibles, no chin
- shovel-shaped incisors

Homo ergaster (erectus)

Homo habilis and Homo ergaster

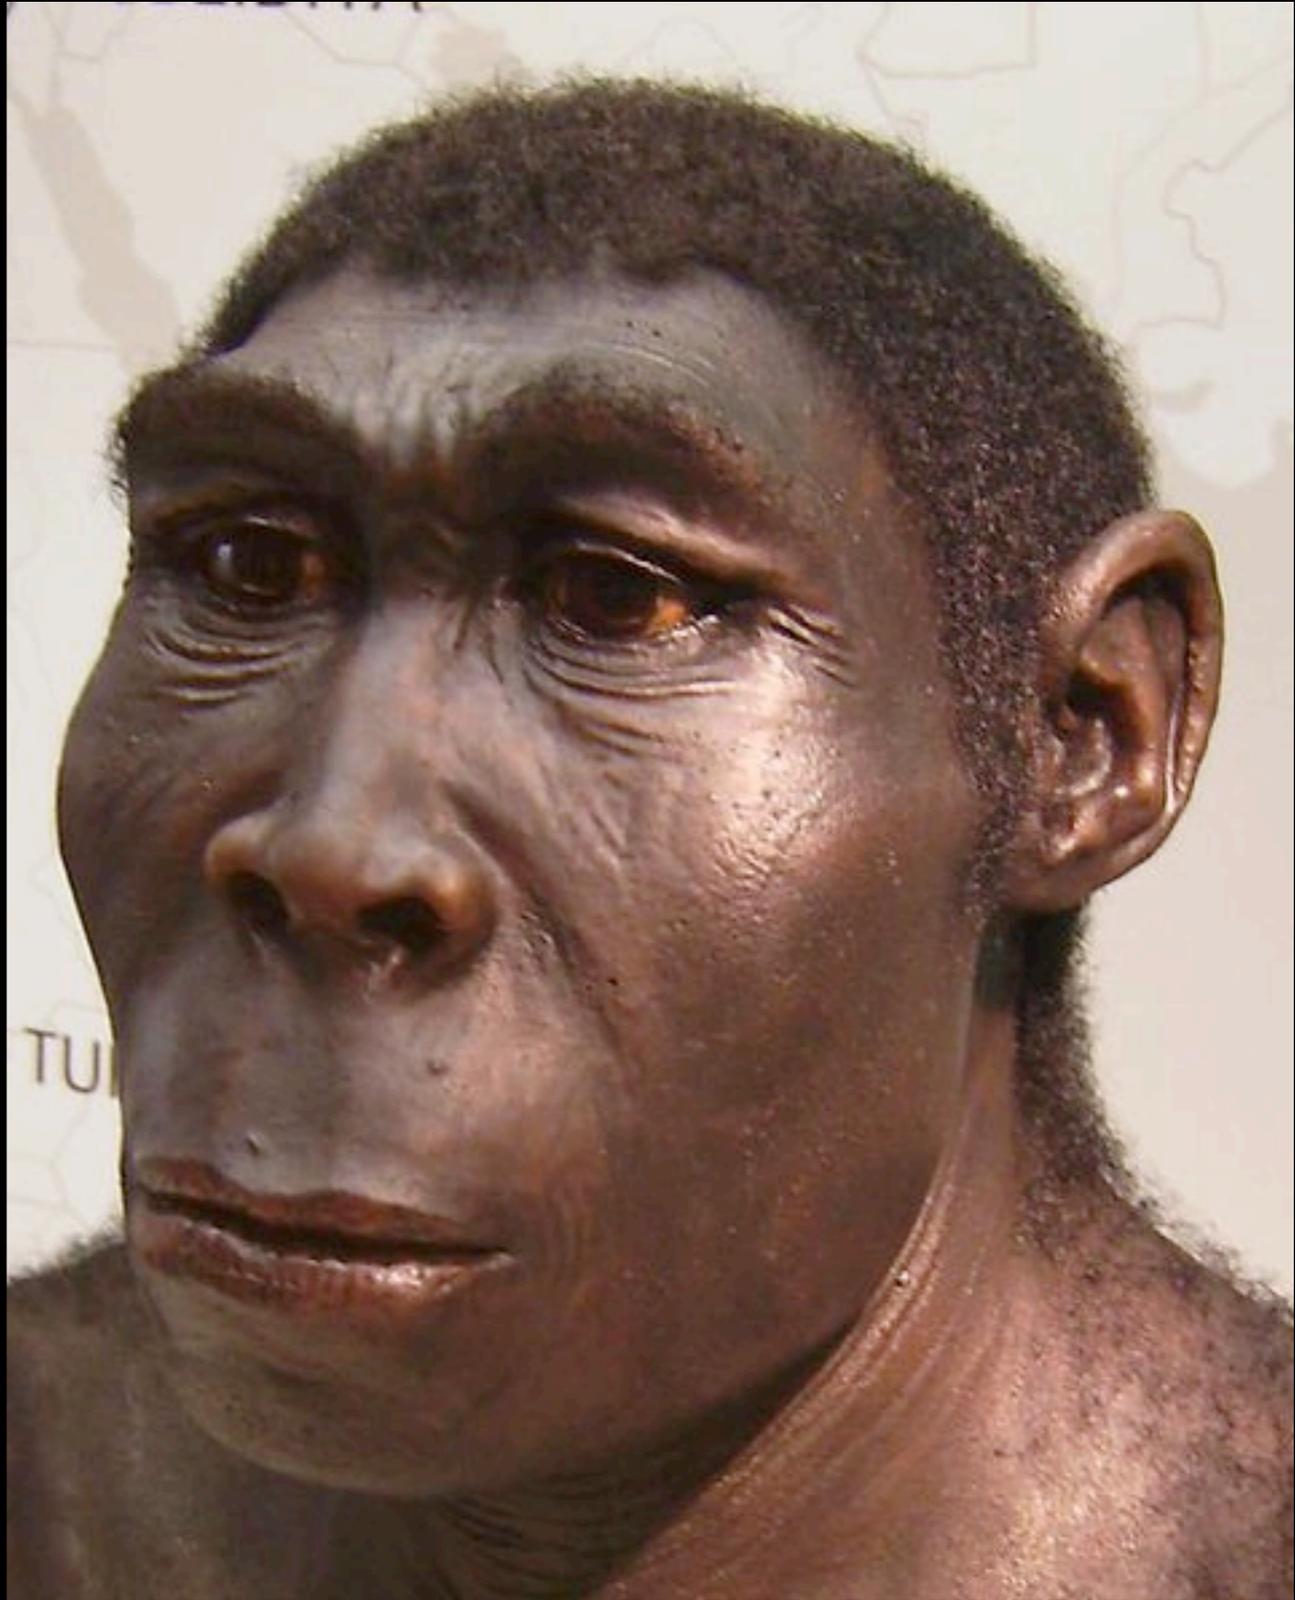

Homo rudolfensis

and

Homo erectus

Homo ergaster

OH 9 - African *Homo erectus*
1.8-0.8 mya

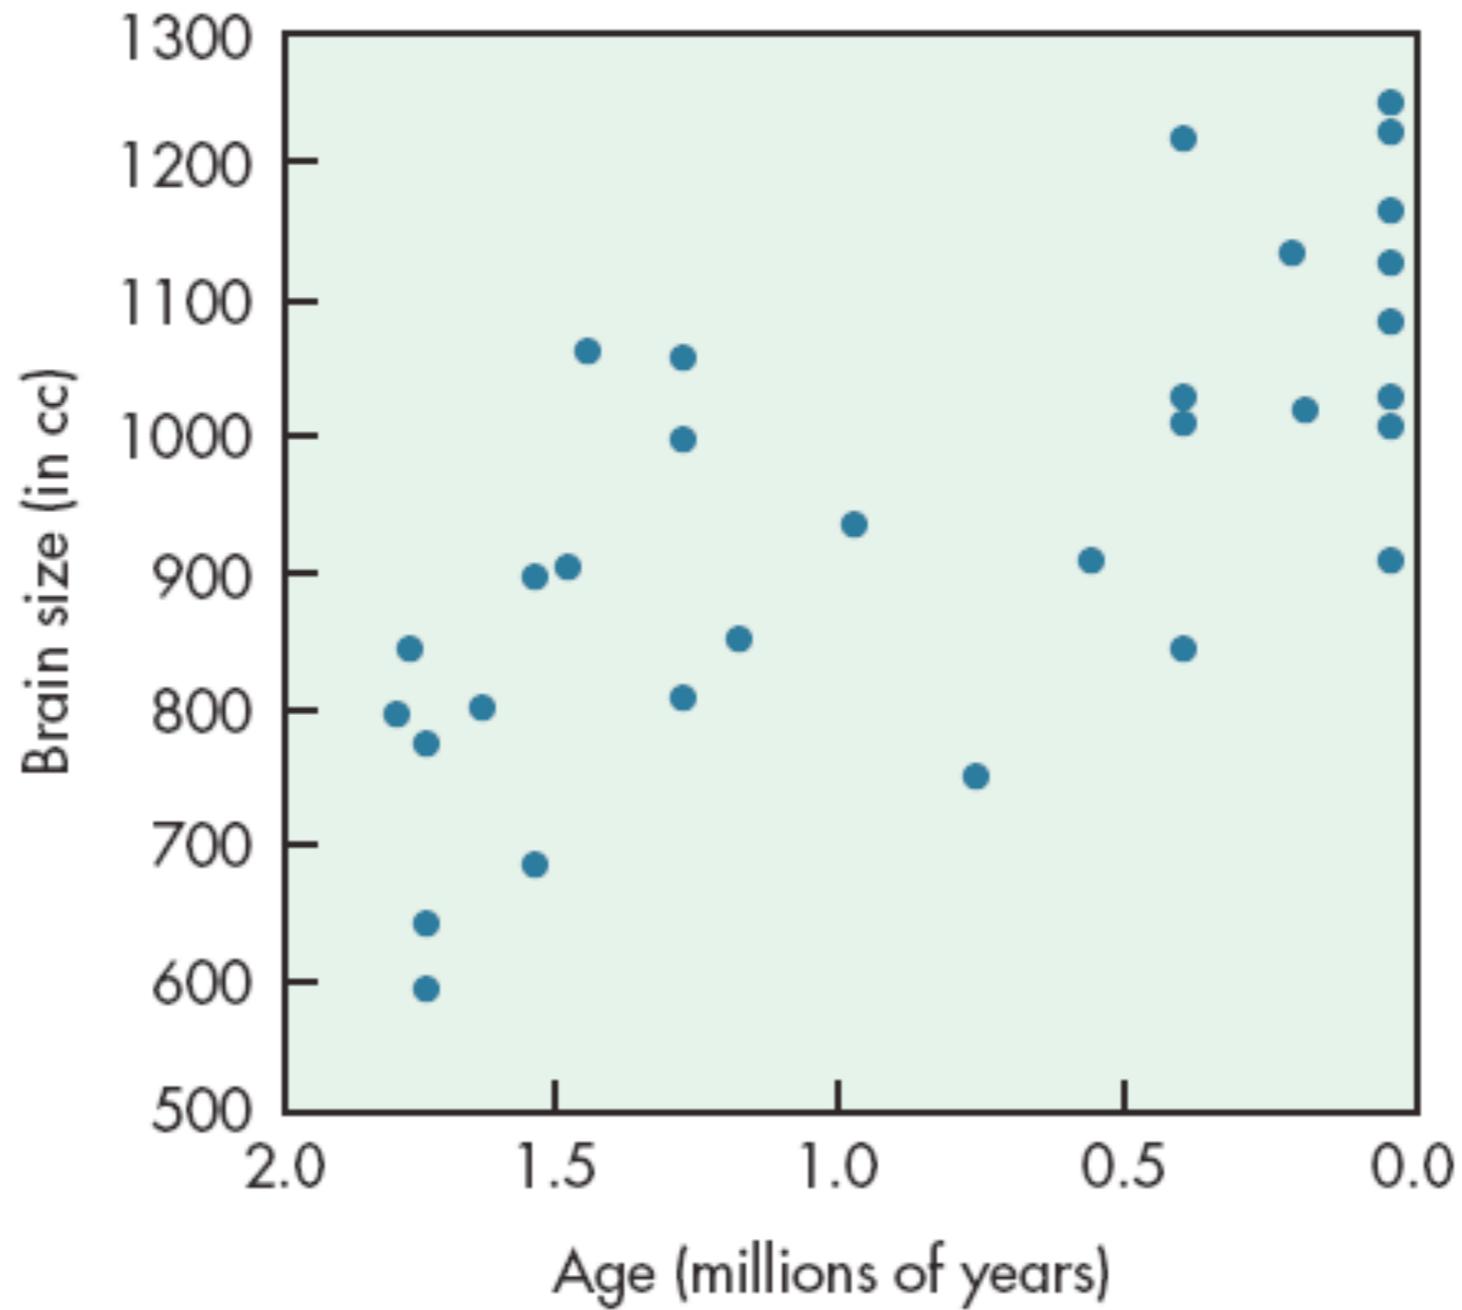

Homo erectus

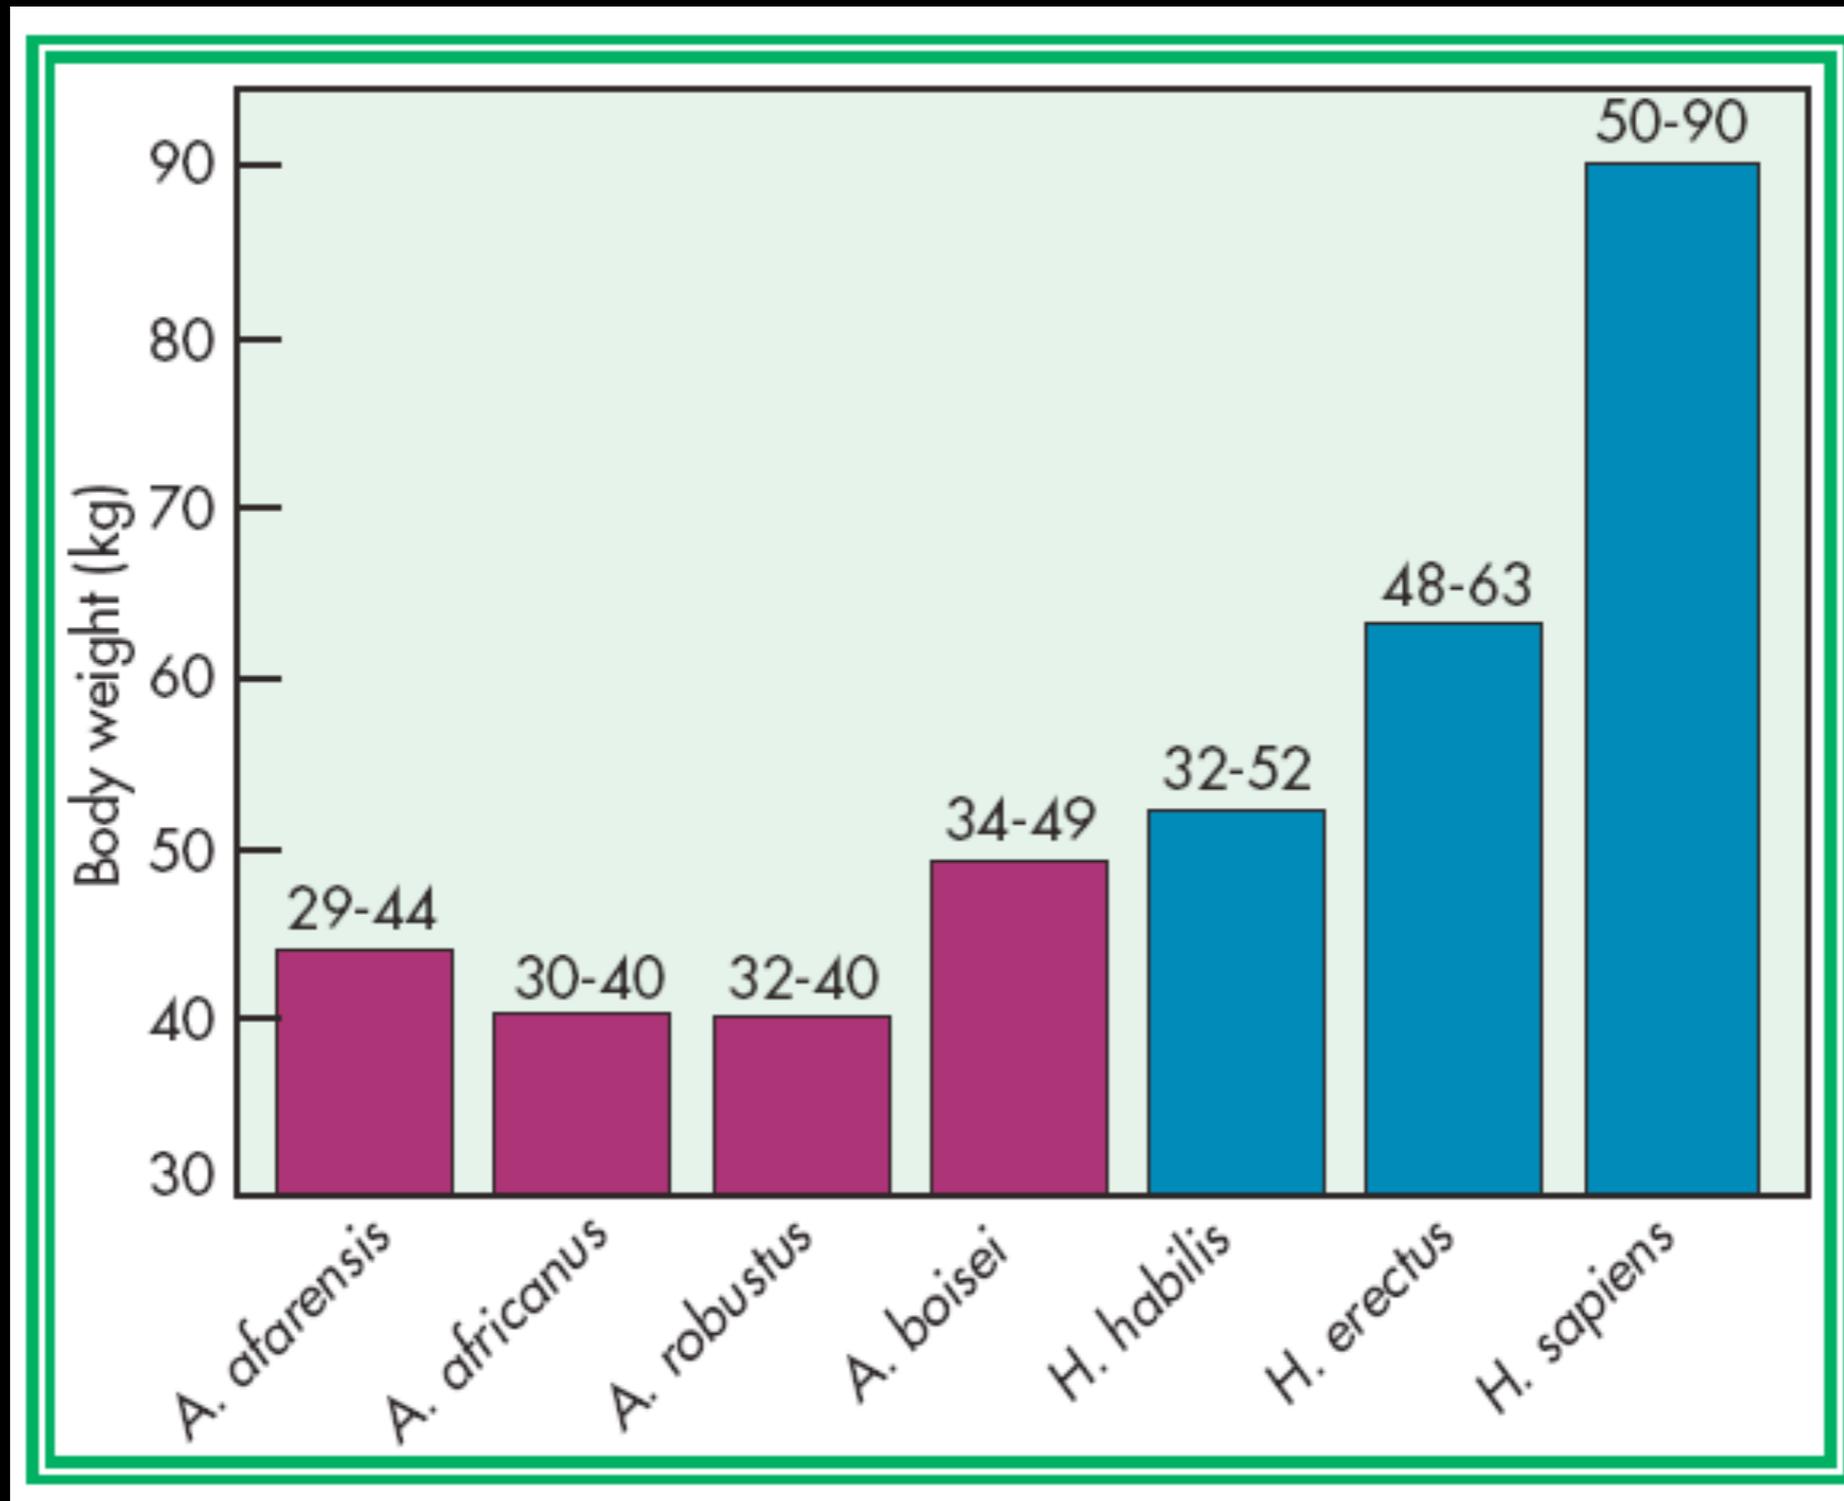

Changing adaptive pattern

- Expanding brain size
- Expanding home range
- Changing diet
- Changing metabolism
- Extended life span
- Changing social behavior?

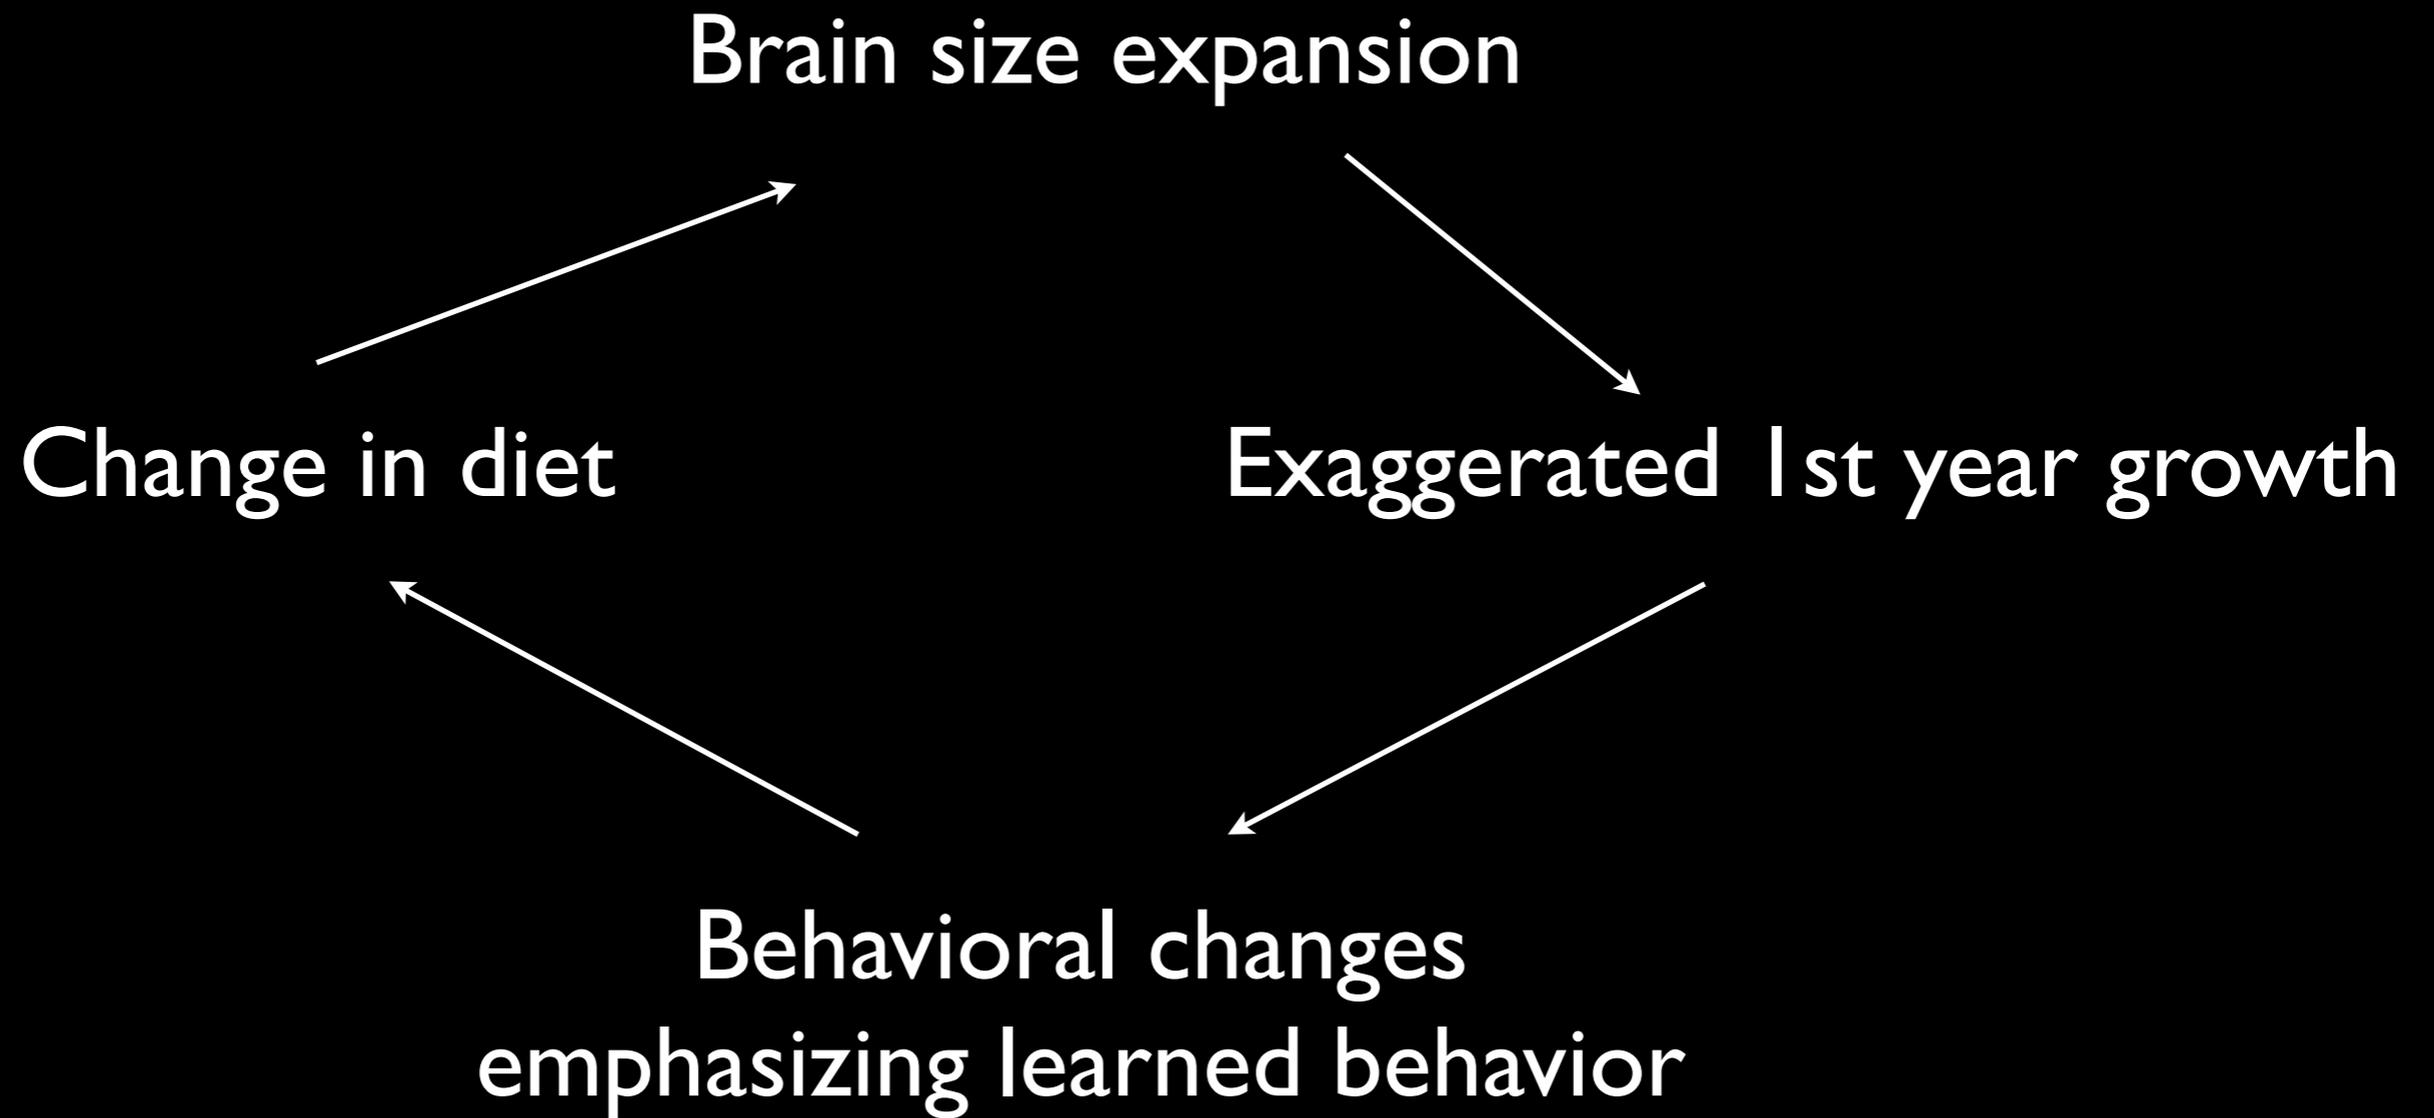

Brain size over time

Body size

Feedback loop

Homo erectus lifeways

- tool technologies that reflect advanced cognitive skills
- Dietary shift to a more heavily meat-based diet than its predecessors

Leave Africa?

- Predation?
- Technology?
- Migrating herds?
- Anatomical changes?

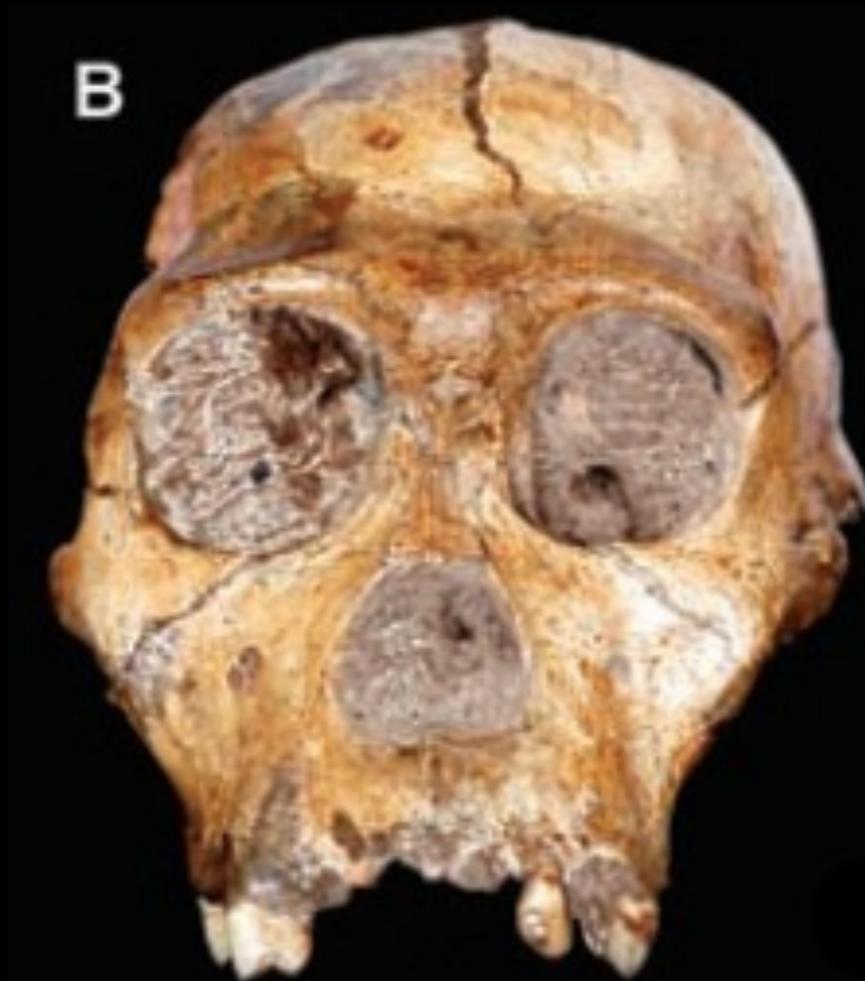

Dmanisi - *H. georgicus*
